- Field of the Invention The present

invention relates to an electronic apparatus provided with a system board. 2. Description of the Related Art

An electronic apparatus that can perform various functions such as a camera function, a recording function, a reproducing function, a transmission function, a reproduction function, and a function of controlling the overall function, has been proposed. In order to obtain the various functions, a system board has been provided. The system board includes a printed-circuit board and a semiconductor chip. The semiconductor chip mounted on the printed-circuit board includes a main circuit that controls the overall function of the electronic apparatus and one or more sub-circuits that are connected to the main circuit via a bus line. Each of the sub-circuits is a circuit that controls a predetermined function of the electronic apparatus and is formed on a single chip or a plurality of chips. In general, a large number of semiconductor chips are mounted on a single system board. However, only one of the semiconductor chips on the system board may malfunction. It is difficult to detect which one of the semiconductor chips has malfunctioned. Each of the semiconductor chips used for the electronic apparatus is provided with a memory that stores information indicating the function of the semiconductor chip and the function that the semiconductor chip is to control. In this case, even if a small amount of information indicating the function of the semiconductor chip is stored in a memory provided in the semiconductor chip, the malfunction of

the electronic apparatus can be prevented by detecting whether or not a malfunction occurs in the semiconductor chip based on the stored information. When information indicating the function of the semiconductor chip is stored in a read only memory (ROM), it is possible to quickly detect the malfunction of the semiconductor chip by reading the stored information from the ROM. Japanese Unexamined Patent Publication No. 11-119689 discloses a semiconductor device that is provided with a ROM that stores information indicating the function of the semiconductor device and an interface circuit that performs data communication with a function control device via a communication bus line. The interface

System Requirements:

Nvidia GTX 670 or above. AMD HD 7970 or above.
Windows 7 64-bit Minimum RAM of 4 GB 1024×768 resolution
The game will support fullscreen mode in windowed mode as well, but the resolution will be lower than the one in fullscreen mode. The game is a testbed for our HDR and V-Sync system and does not have an actual lighting system in place. The game will look best on NVIDIA Kepler or above GPU (e.g. GTX670 or above)
